

- We have completed integration of the 'toebes-blockly' library
  - Found this to be much better than EasyJ
  - More compatible and easier to modify for our use
  - Currently integrating new changes made by the original repository
  - Will talk to david about making the integration of these changes easier
- Continued creating generating code for custom blocks
- Started creating some test cases for our new blocks
  - Tried using Junit for testing but have come across problems caused by the blockly requiring other libraries.
  - We will not be testing the blockly generator itself since this will be tested by the original creator
