

I have used 12-grid bootstrap in this project. It has a pre-defined column metrics
As shown in the following table

Column name (N is the number of columns 1 to 12)	size
.col-xs-N	<768
.col-sm-N	>=768
.col-md-N	>=992
.col-lg-N	>=1200

I was able to setup breakpoints and defined the size for each column when that breakpoint hit. I also set the container size to start from 1400px for wide screen without redefined the pre defined column size value. That makes my work easier and faster.

This week I also did some catch up with old issues in trello system. Next week I will do some enhancement in the UI especially the grid in the test page.
